Neuro-Systemic Applications in Learning Kennedy
Andrew Thomas 2021-09-01 Neuroscience
research deals with the physiology, biochemistry,
anatomy and molecular biology of neurons and
neural circuits and especially their association
with behavior and learning. Of late, neuroscience
research is playing a pivotal role in industry,
science writing, government program
management, science advocacy, and education.
In the process of learning as experiencing
knowledge, the human brain plays a vital role as
the central governing system to map the images
of learning in the human brain which may be

called educational neuroscience. It provides
means to develop a common language and
bridge the gulf between educators, psychologists
and neuroscientists. The emerging field of
educational neuroscience presents opportunities
as well as challenges for education, especially
when it comes to assess the learning disorders
and learning intentions of the students. The most
effective learning involves recruiting multiple
regions of the brain for the learning task. These
regions are associated with such functions as
memory, the various senses, volitional control,
and higher levels of cognitive functioning. By

considering biological factors, research has advanced the understanding of specific learning difficulties, such as dyslexia and dyscalculia. Likewise, neuroscience is uncovering why certain types of learning are more rewarding than others. Of late, a lot of research has gone in the field of neural networks and deep learning. It is worthwhile to consider these research areas in investigating the interplay between the human brain and human formal/natural learning. This book is intended to bring together the recent advances in neuroscience research and their influence on the evolving learning systems with

special emphasis on the evolution of a learner-centric framework in outcome based education by taking into cognizance the learning abilities and intentions of the learners.
